This is the main line. Five transactions, five documents, with the same quantity and amount carried all the way through: **300 PC × 720.00 = 216,000.00 USD**. Each step gives the screen reproduction, the keystrokes, the key fields and what the status bar should say — and at the end the Purchase Order History in ME23N ties it all together.

Step 1 — ME51N: turn "what we need" into a requisition

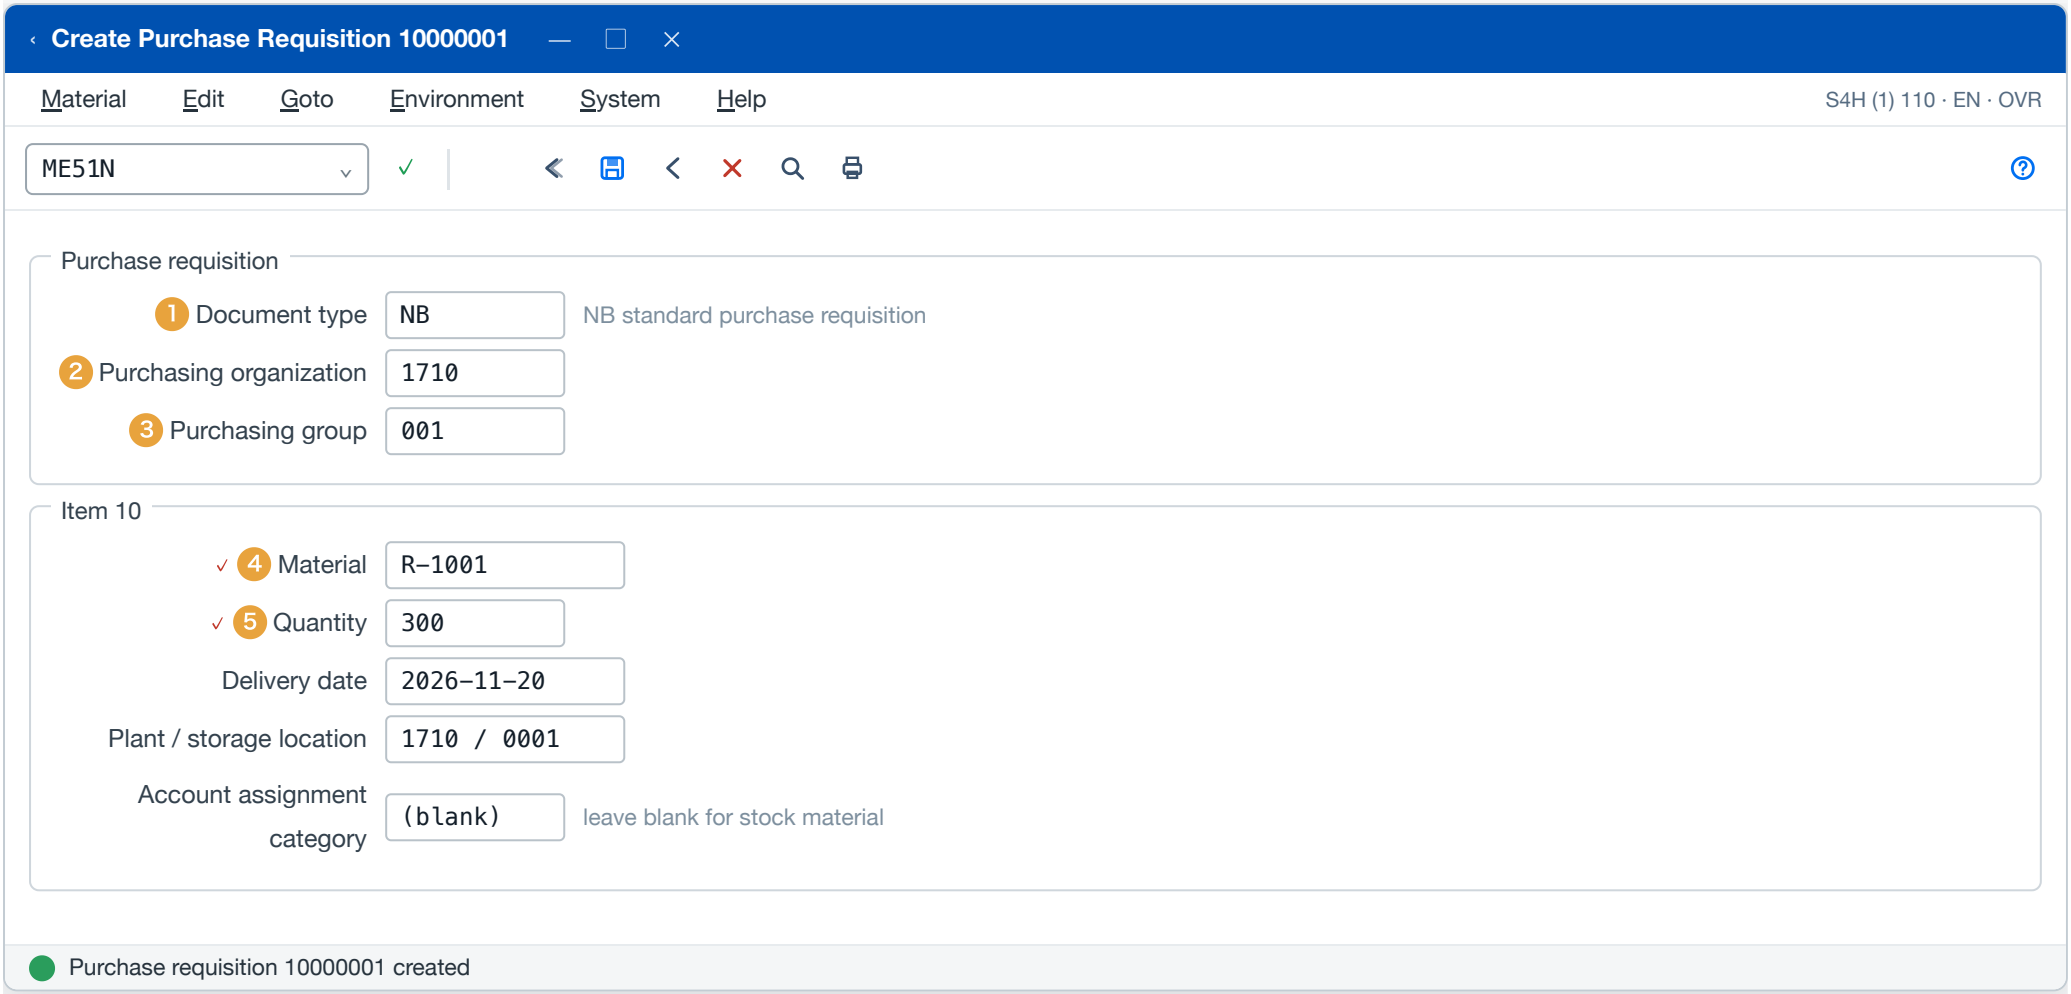

Figure 4-1 A requisition is internal demand only and **creates no accounting document**. Account assignment category: leave it blank for stock material; use K (cost center), F (order) or P (project) for consumables.

Field	Value	Notes
Document type	NB	Standard purchase requisition; requisitions needing approval use NB with a release strategy

Material / quantity	R-1001 / 300	The unit follows the material's base unit of measure, PC
Delivery date	2026-11-20	Both MRP and the vendor's lead time are scheduled backwards from this date
Plant	1710	Must already exist in the material master, otherwise "Material not maintained in plant"

Step 2 — ME21N: requisition → purchase order

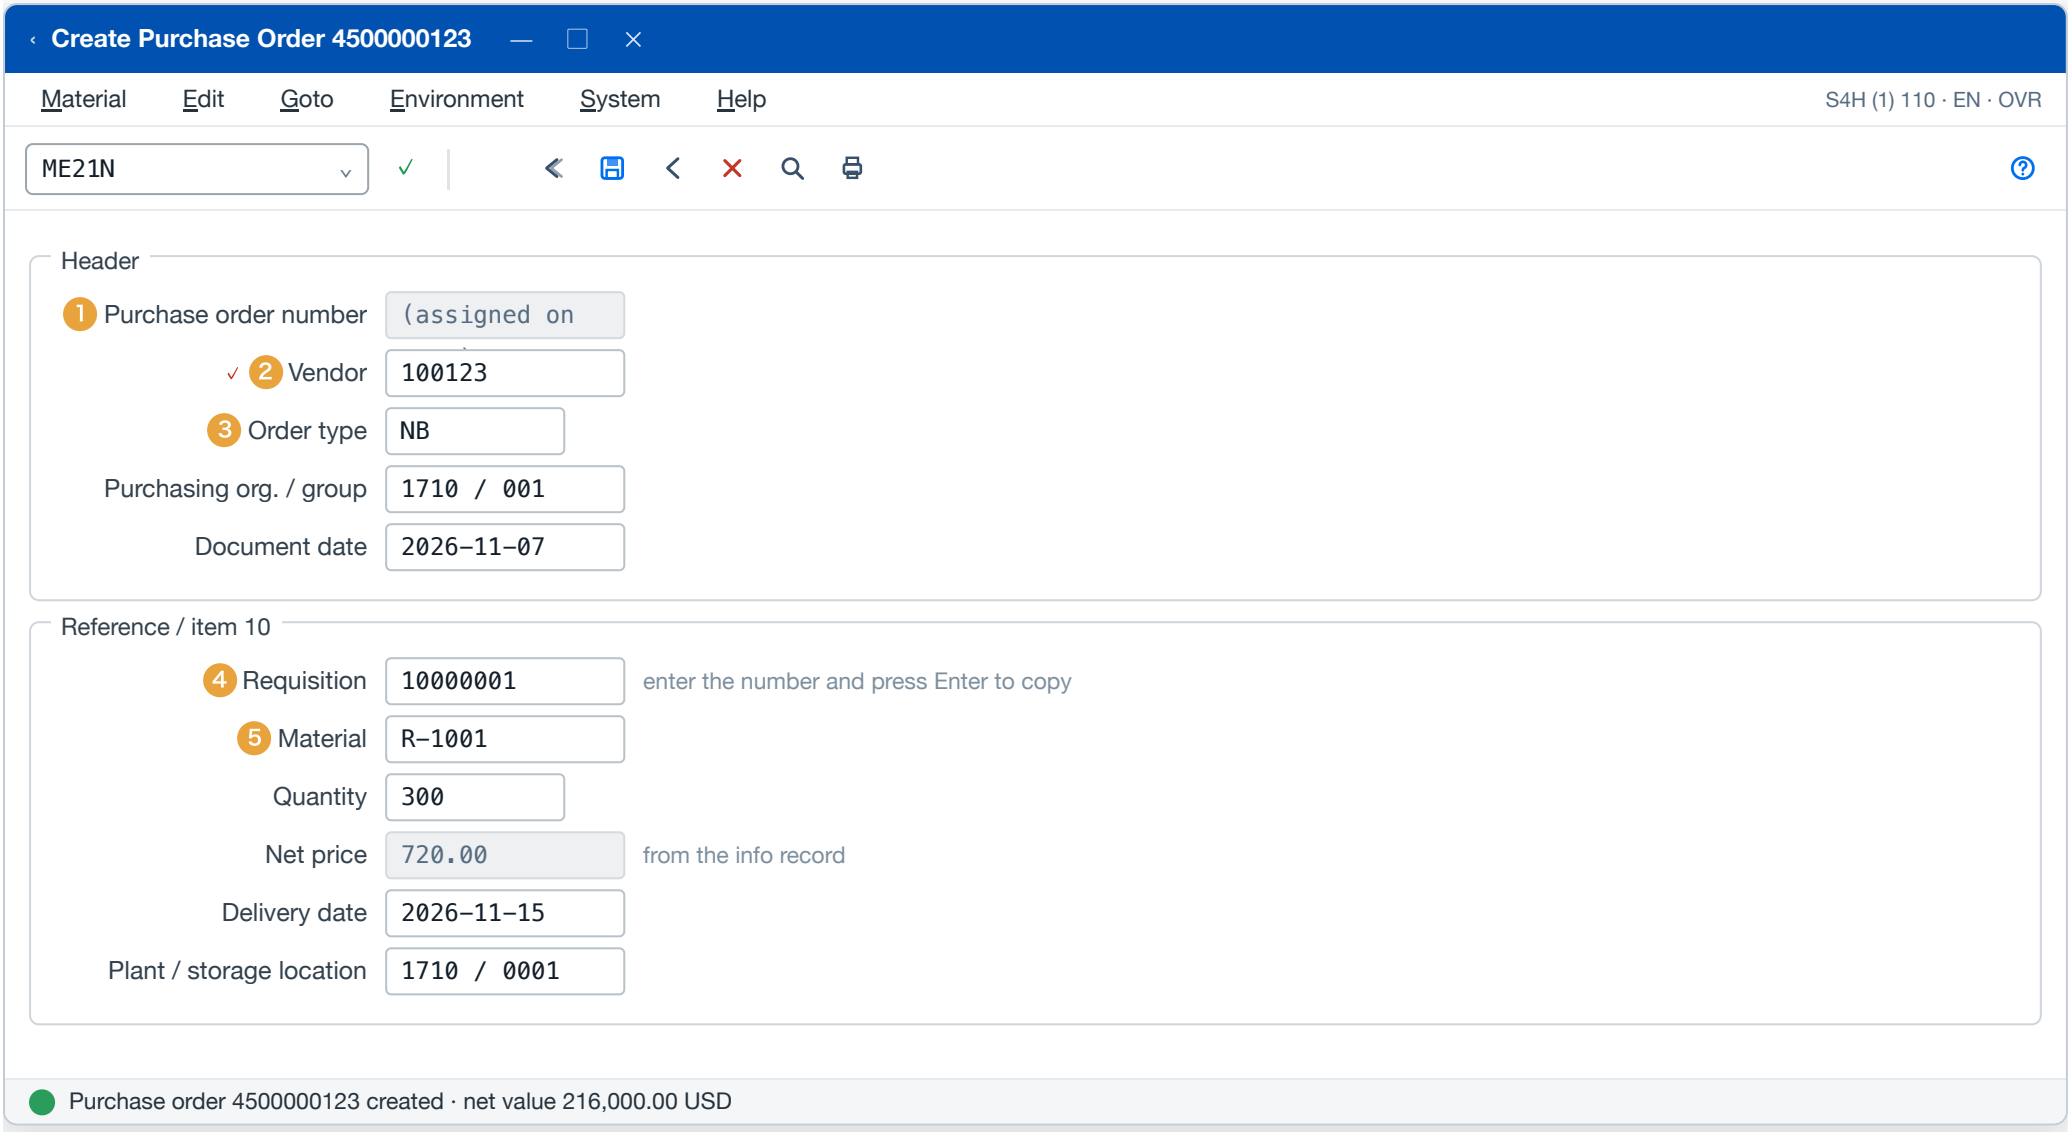

Figure 4-2 Referencing the requisition is the fastest route: enter its number, press Enter, and material, quantity and delivery date are copied. **The net price is read-only** — it comes from the ME11 info record, it is not typed here.

Saving the PO is not the end of it

A saved order is still "not released", which does not block goods receipt in this course because no release strategy is configured. On real projects a purchase order often has to be **released** before goods may be received, either with ME29N or through the approval transactions, after which the status reads "released".

Step 3 — MIGO: goods receipt 101, stock + and accrual +

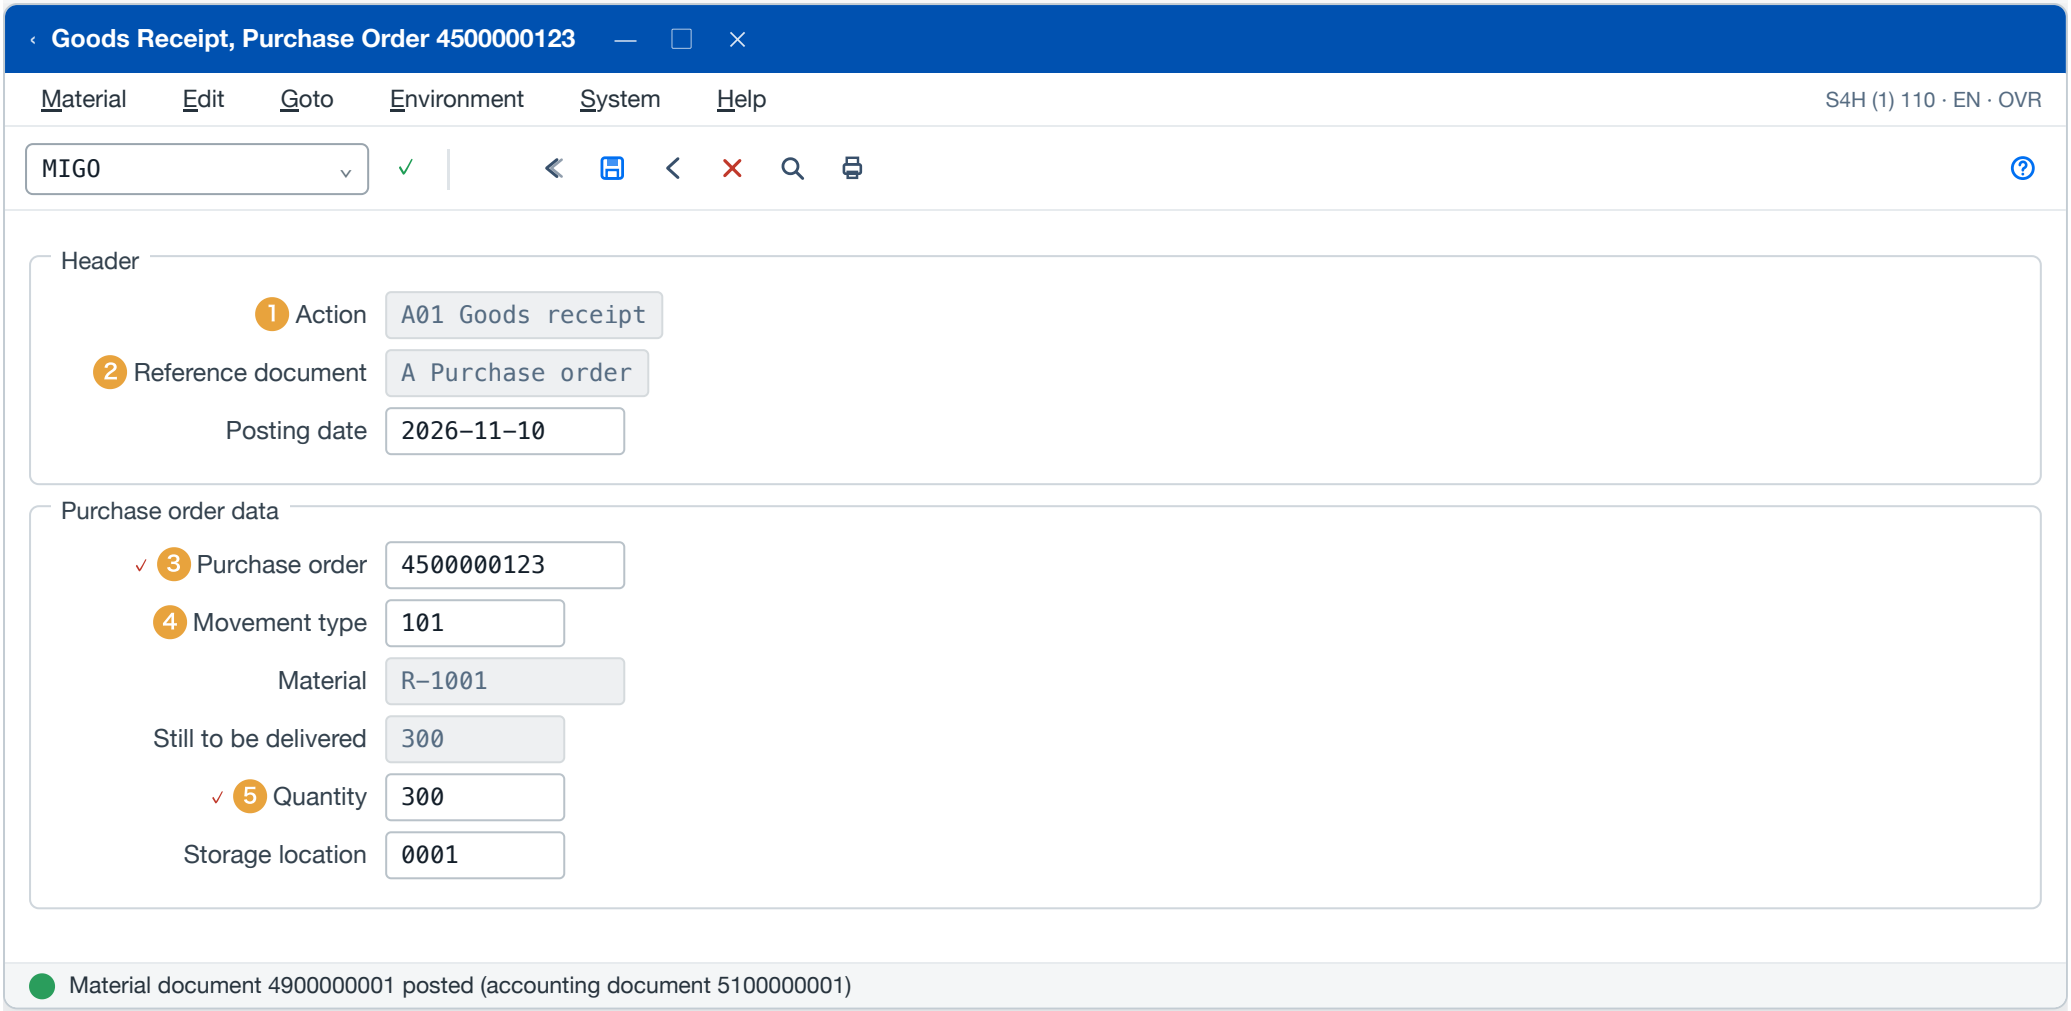

Figure 4-3 MIGO is the single entry point for goods movements: choose action A01, reference A Purchase order, enter the number and press Enter — the details are copied. **A quantity above "still to be delivered × 1.1" is rejected** (delivery tolerance).

Five checks before posting	What you should see here	What happens if it is wrong

Is the reference document right?	A Purchase order → 4500000123	A wrong reference (for example R Other) copies no order quantity
Movement type	101	501 would hit a consumption account and raise no GR/IR liability
Quantity ≤ still to be delivered ± tolerance	300 / 300	Over-receipt gives "Goods receipt quantity exceeds the allowed tolerance"
Storage location	0001	A storage location that is not active gives "Storage location does not exist"
Posting date inside an open period	2026-11-10 (November is open)	A closed period gives "Posting period 2026/11 is not open" (check OB52)

Step 4 — MIRO: three-way match, accrual becomes payables

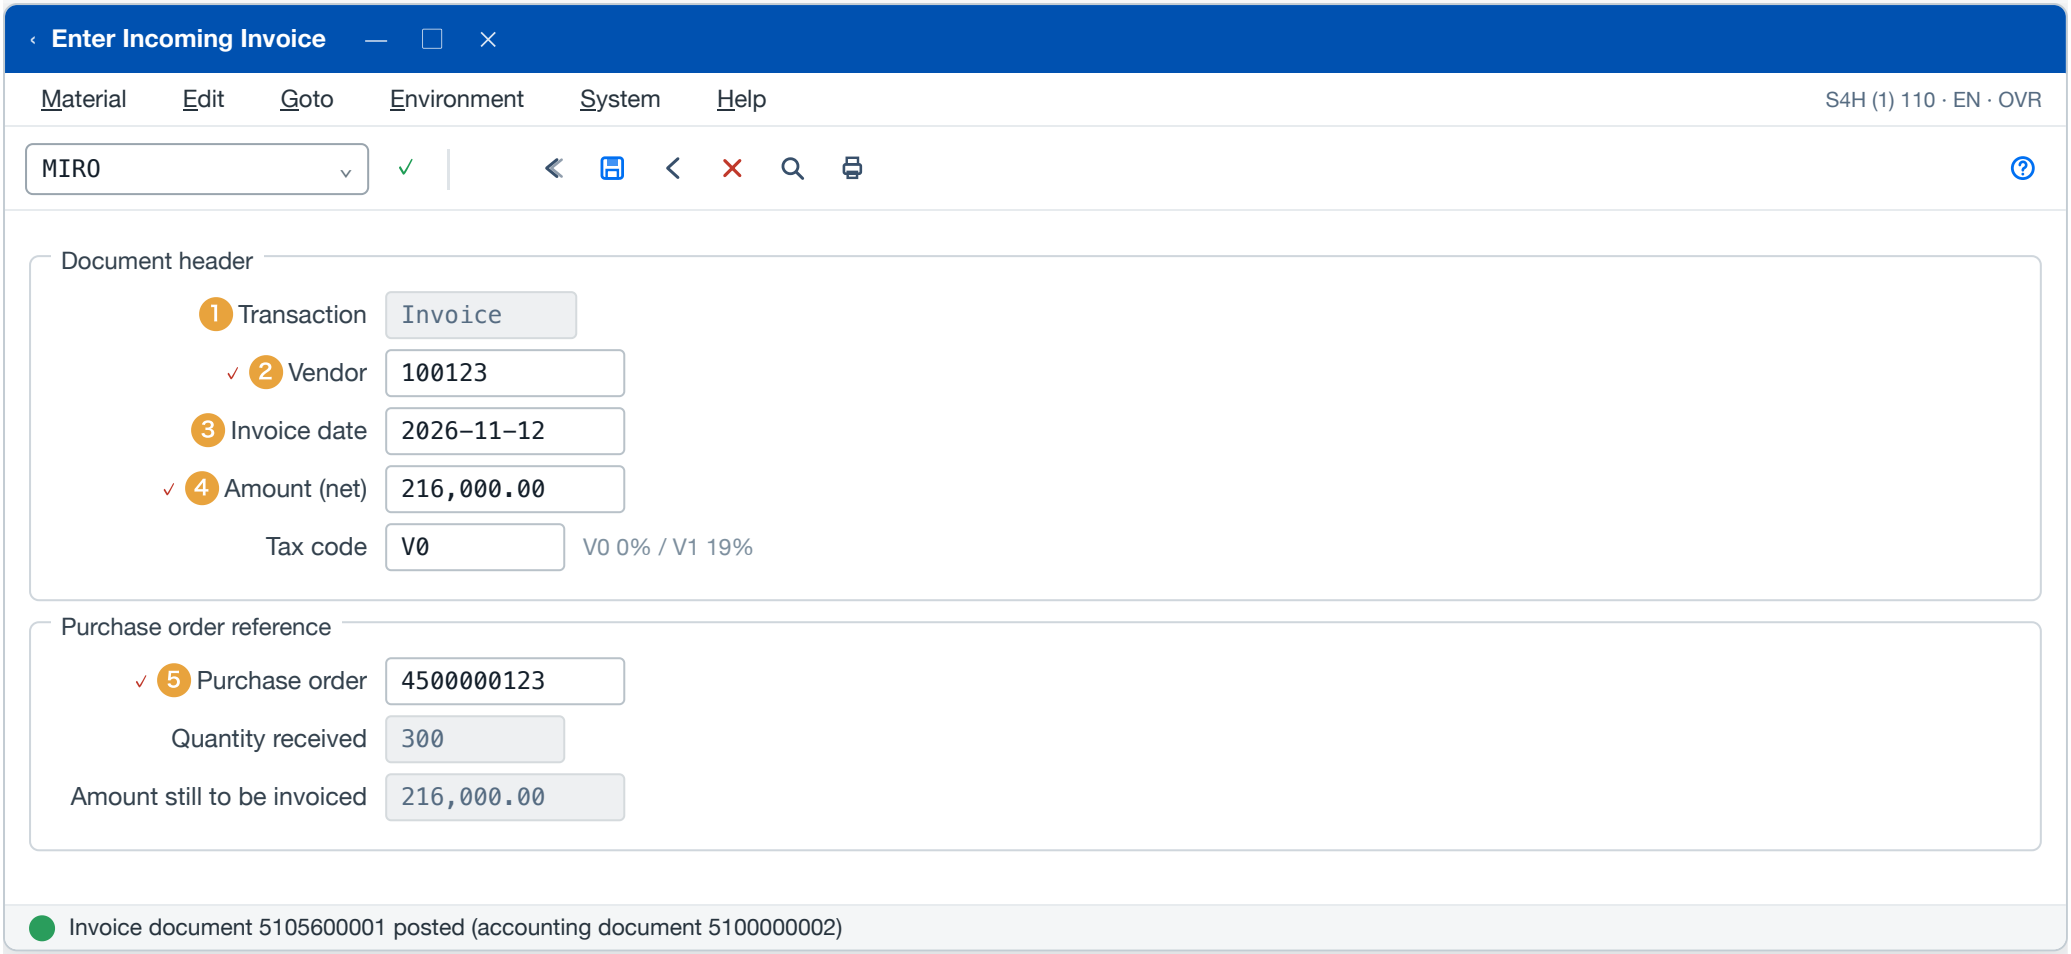

Figure 4-4 MIRO performs the three-way match: order 300 × 720 = 216,000; goods receipt 300 PC; invoice 216,000. When all three agree it is green all the way and GR/IR returns to zero.

What happens if the amount is more than 1% out

Enter 219,000 (more than 1% above 216,000) → the status bar reports **Price too high (exceeds tolerance limit 1.000 %) — message M8083** and the invoice will not post. Tolerances are configured per company code in OMR6 (BD small difference / DQ quantity deviation / PP price change / VP moving average variance). A small difference (≤ 1%) is allowed to post, goes to a small-difference account, and **blocks** the invoice, so payment requires MRBR to release it first.

Step 5 — F-53: pay and clear

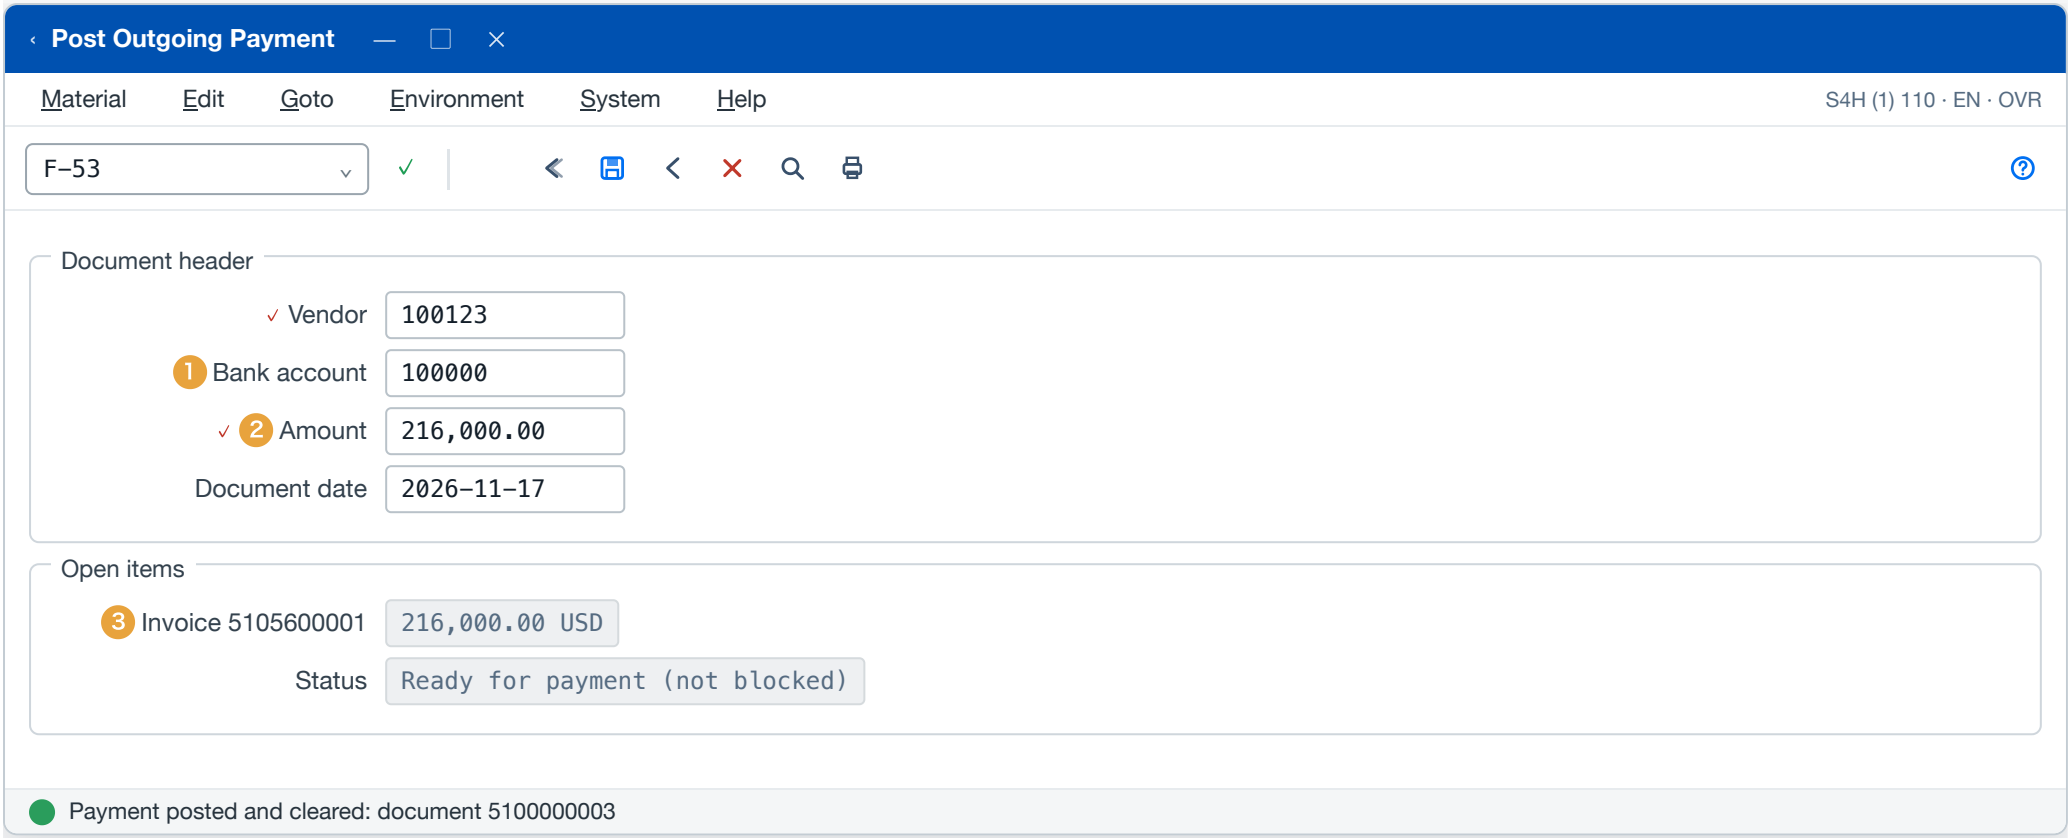

Figure 4-5 Manual payment in F-53: enter the vendor → open items are listed → enter the amount and the bank account → save. **If the invoice is blocked, this reports "Blocked invoices exist, release them in MRBR first"**.

What happened in the books across the five steps

Stage	Document numbers	Debit	Credit	Amount USD	Balance effect
Goods receipt 101	4900000001 / 5100000001	140000 Inventory	191100 GR/IR clearing	216,000.00	Stock 0 → 300 PC

Invoice MIRO	5105600001 / 5100000002	191100 GR/IR clearing	160000 Payables	216,000.00	GR/IR back to zero
Payment F-53	5100000003	160000 Payables	100000 Bank	216,000.00	Payables back to zero

- [ ] Open 4500000123 in ME23N: item 300 PC, net price 720.00, net value 216,000.00
- [ ] In the Purchase Order History tab: created / received 300 / invoiced 300 / paid are all present
- [ ] MMBE: R-1001 at 1710 / 0001 shows 300 PC of unrestricted stock
- [ ] MB5S: the GR/IR balance for this PO is 0.00, total 0.00
- [ ] Open 5100000001 and 5100000002 in FB03: debit and credit 216,000.00 each, accounts matching the table above
- [ ] After F-53, check FBL1N (vendor line items): the invoice is cleared, no open items remain

Status bar message	Root cause	First transaction to check
Purchase order 4500000123 does not exist	Number mistyped, or the order was never saved	ME23N or ME2L
Goods receipt quantity exceeds allowed tolerance	Quantity > still to be delivered × 1.1	ME23N for the open quantity; change the MIGO quantity or reverse with 102 first
Purchase order 4500000123 has no goods receipt, cannot be invoiced	Goods receipt was skipped	Run MIGO first, or switch off GR-based IV and invoice (ME12)
Price too high (exceeds tolerance limit 1.000 %) — M8083	Invoice amount exceeds the order net value by more than 1%	Check the invoice; handle the variance via OMR6 or correct the amount
No open items to clear	Wrong vendor, or the invoice is blocked	FBL1N for open items; release in MRBR

Posting period 2026/11 is not open	The GL period is closed	Check the period in OB52; for MM periods use MMPV/MMRV
